

Scripting and Automation

Automate and orchestrate:

- You don't have to be there
- Solves problems in your sleep
- Monitor and resolves problems before they happen

The need for speed

They fast

Automate mundane tasks

Automation benefits

Save time

Enforce baselines

Standard infrastructure configs (like a default config)

Secure scaling:

- Orchestrate cloud resources
- Quickly scale up and down
- Automation Ensures proper security is added

Employee rendition:

- Automate the boring stuff
- Ease the workload
- Minimize the mundane tasks
- Employees work is rewarding instead of repetitive

Automation reacts fast to problems

Workforce multiplier:

- Scripting works 24/7

Cases for automation:

User and resource provisioning:

- On boarding and off boarding
- Assigns to specific resources

Guard rails:

A set of automated validations

Security groups;

- Assign (or remove) group access
- Constant audits without intervention

Ticket creation:

- Automatically identify issues
- Script email submissions into a ticket

Escalation:

- Correct issues before involving a human

Automation can basically just make our lives easier by doing simple straightforward tasks

Automation is complicated and have to work with moving parts and the cost a lot and they also might fail

Scripting considerations:

- Tech debt:
- Patching problems may push the issue down the road

Also require ongoing maintenance
